# Business Process Management

- Hammer & Champy [1993] “A collection of activities that takes one or more kinds of input and creates an output that is of value to the customer.”
- Davenport [1992] “A structured, measured set of activities designed to produce a specific output for a particular customer or market. It implies a strong emphasis on how work is done within an organization, in contrast to a product focus’s emphasis on what.”

# Composition

- Services provide *platform- and language-independent access to software components*
- But these components are *isolated*: they need to be *assembled* into *service-oriented architectures*
- Ideally, they should be recursively *composable* to form composite services in their own right
- *Workflow* languages for scripting or ‘glue’ between individual services
- BPMN, WSCI, WSFL, XLANG, BPEL. . .
- beyond mere *business protocol specifications* like RosettaNet, which are essentially paper specifications so can’t be automated and won’t scale

# Removal of Dependencies (Leymann and Roller)

- DBMS provides independence from data *representation*; workflow provides independence from control or data *flow*.

# Heritage

- *Enterprise application integration (EAI)*
  - resolving heterogeneity, typically via asynchronous *message brokers*
- *Workflow management systems (WfMS): automating interactions*
  - origins in *office automation*: admin processes
- *Production workflows: from information between people to integration of systems*
  - often associated with *business process re-engineering*: assessment, analysis, modelling, definition, implementation
- Service composition = EAI + WfMS

# Motivations

- Model Business Processes
  - Understand what happens?
  - Who is responsible?
  - What is involved?
- Simulate
  - Improve and model
- Execute
  - Automate processes
  - Improve them more quickly
- Monitor
  - Get a real-time health status of processes

# Orchestration vs Choreography

# Orchestration vs Choreography

- *Orchestration*
  - Describes procedure
  - instructs participants globally – imperative; centralized
  - typically deterministic: ‘must’
- *Choreography*
  - Describes protocol
  - Constraints on interaction, but participants act locally – declarative; no ‘current state’
  - Usually non-deterministic: ‘may’
- Orchestra has a conductor, Ballet does not

# WS-Choreography Description Language

- <http://www.w3.org/TR/ws-cdl-10/>
- Never got past Candidate Recommendation
- Captures the flow of messages between parties
- Temporal and logical dependencies between messages
- features sequencing rules, correlation, exception handling and transactions
- Not executable

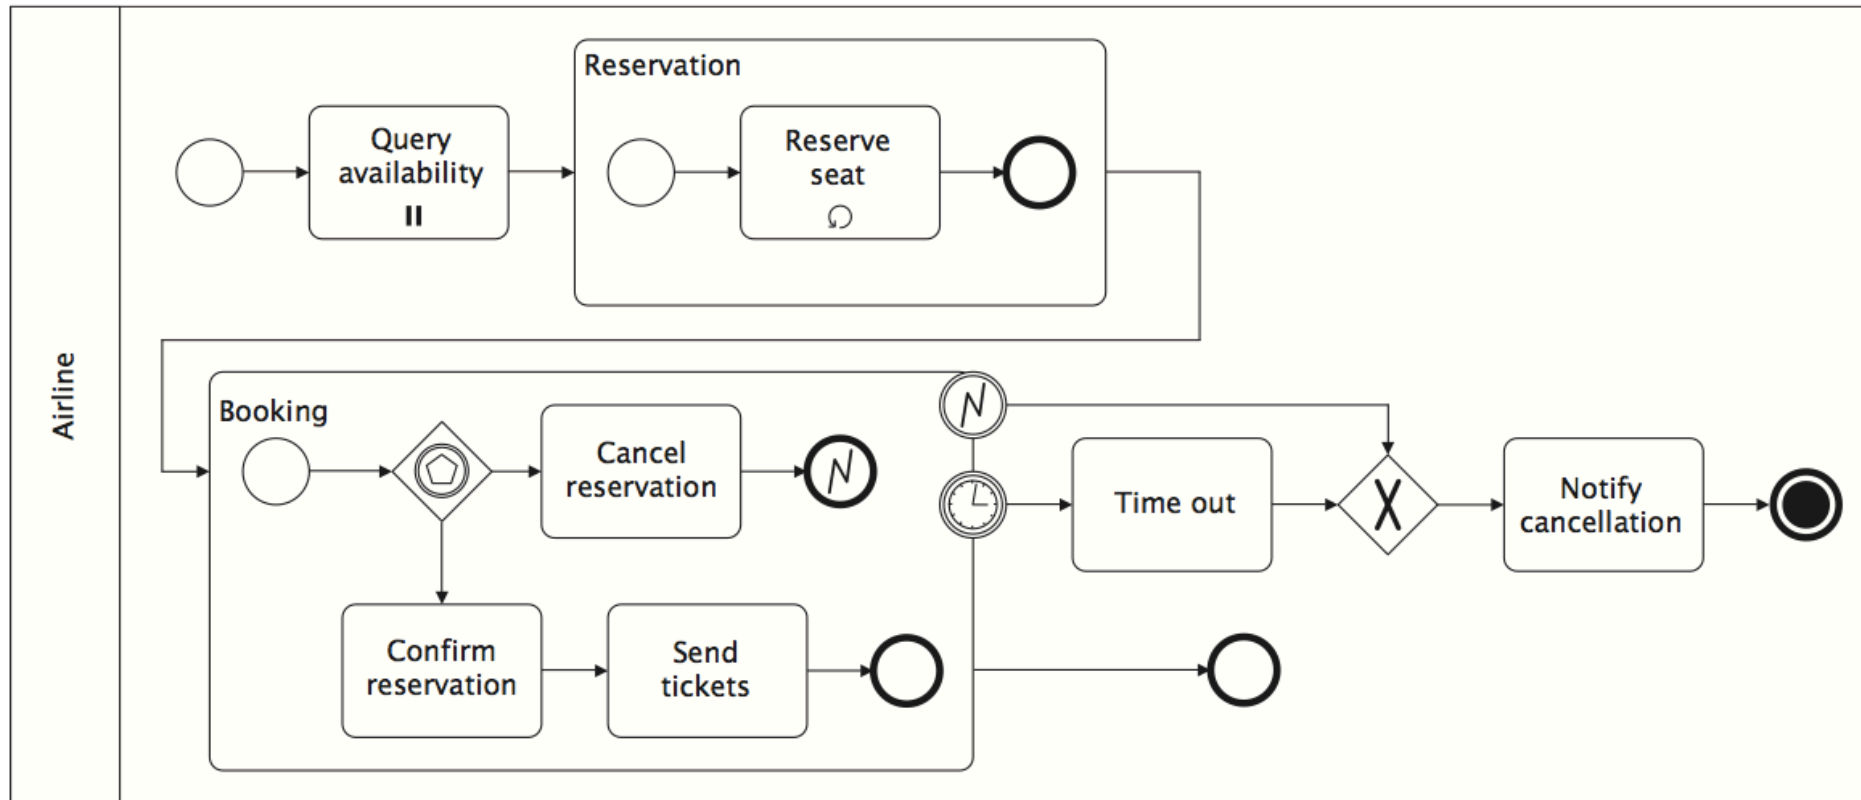

# BPMN 1.1

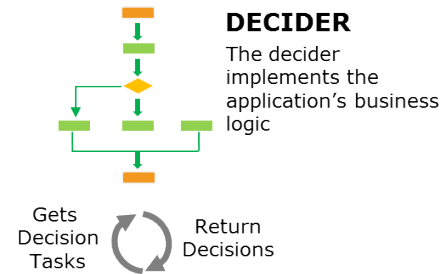

- Designed to allow process designers to communicate
  - Think UML
- Activities, Gateways, Events
- Control and Data Flow
- Organization modelling (Pools, Swimlanes)

# BPMN Example

# Amazon Simple Workflow Service

## Amazon SWF

- Maintains distributed application state
- Tracks workflow executions
- Ensures consistency of execution history
- Provides visibility into executions
- Holds and dispatches tasks
- Provides control over task distribution
- Retains workflow execution history

<http://aws.amazon.com/swf/>

## Cloud

Workers for Activity 1

## Mobile

Workers for Activity 2

## On Premises

Workers for Activity 3

# Business Process Execution Language (BPEL)

- Standardised XML language for executable processes
- Well defined execution
  - No deadlocks
  - Graphs must be acyclic
- Tied to WSDL concepts
- No built in support for human activities (though this has been added)
- No graphical notation

© Paul Fremantle 2012. Portions © Jeremy Gibbons 2010, © WSO2 2005-2012 used with permission of the author(s).

Licensed under the Creative Commons 3.0 BY-SA (Attribution-Sharealike) license.

See <http://creativecommons.org/licenses/by-sa/3.0/>

# The main strength of BPEL

(IMO)

- BPEL is a completely executable standalone language
  - PartnerLinks define places where you can call WSDL services
  - Or where other parties can call WSDL Services into the process
- Deployment descriptor + BPEL can be executed without any Java or other language

# The main weaknesses of BPEL

(IMO)

- Too much like a programming language
  - Need WS-HumanTask, BPEL4People and script or Java extensions to make it useful for real processes
- No swimlanes (explained in a minute)
- No common visual notation

# BPMN + BPEL

- In theory:
  - Process experts design and model in BPMN
  - Developers/Implementors implement in BPEL
- No standard bridging/mapping
  - Double the effort

# BPMN 2.0

- A notation for a subset of BPEL
- Execution semantics for BPMN
- Notational support for choreography
- The best of both worlds?

# CMMN

## Case Management and Modelling Notation

- A specification from OMG for modelling how to handle cases
- A more flexible approach to workflow than BPMN or BPEL
  - Certain workflows are very clear
    - Building a car
  - Others are more flexible
    - Hand building a mandolin
- Imperative vs “Causative”

# BPMN 2.0

# BPMN 2.0 Basics

# BPMN Basic Constructs

- Events

- Activities

- Gateways

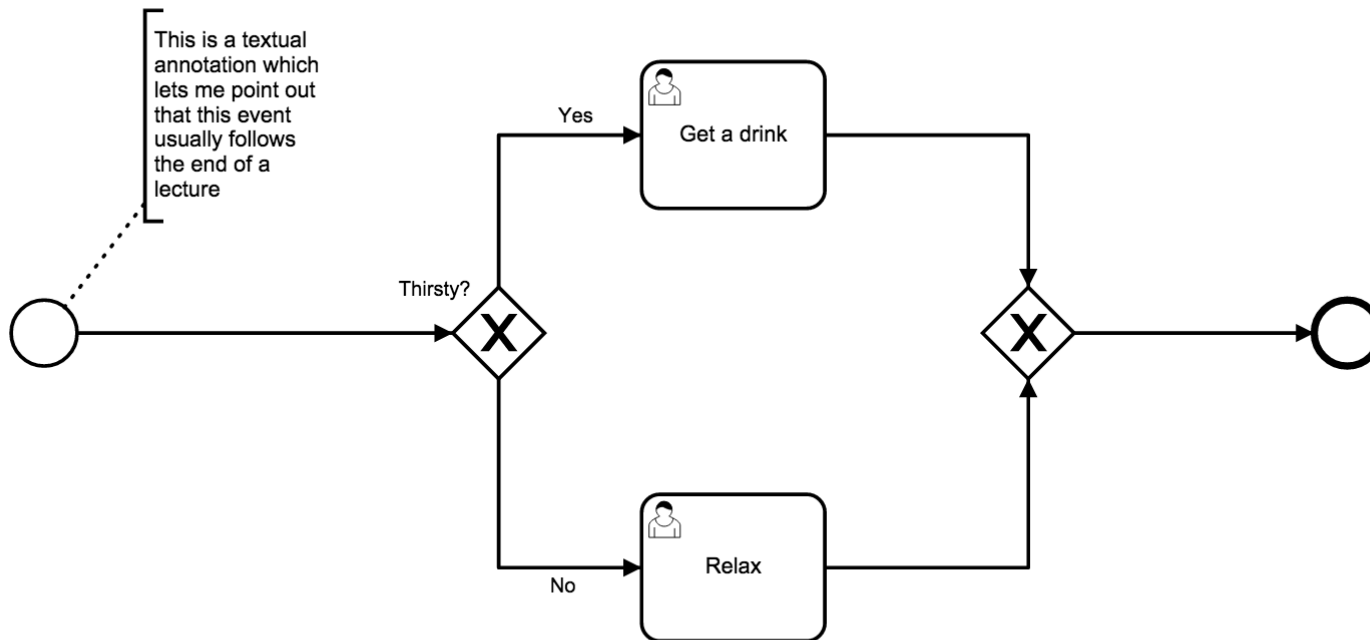

- Sequence Flows

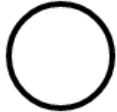

# Text Annotations

- How you document your processes

# Start Events

- Start Event 
  - Message Start 
  - Timer Start 
  - Conditional Start 
  - Signal Start 

# Some Intermediate Events

Basic Intermediate Event

Message Catch

Message Throw

Timer

Escalation

See <http://creativecommons.org/licenses/by-sa/3.0/>

# Some End Events

# Activities

Send Task  
- sends a message

Business Rule Task  
- implemented by a BR engine

Receive Task  
- receives a message

Service Task  
- implemented by a service

User Task  
- requires input  
or action from a  
user, mediated  
by the engine

Script Task  
- implemented by a script

Manual Task  
- completely manual task (out  
side the engine)

Call Activity-  
calls another  
process

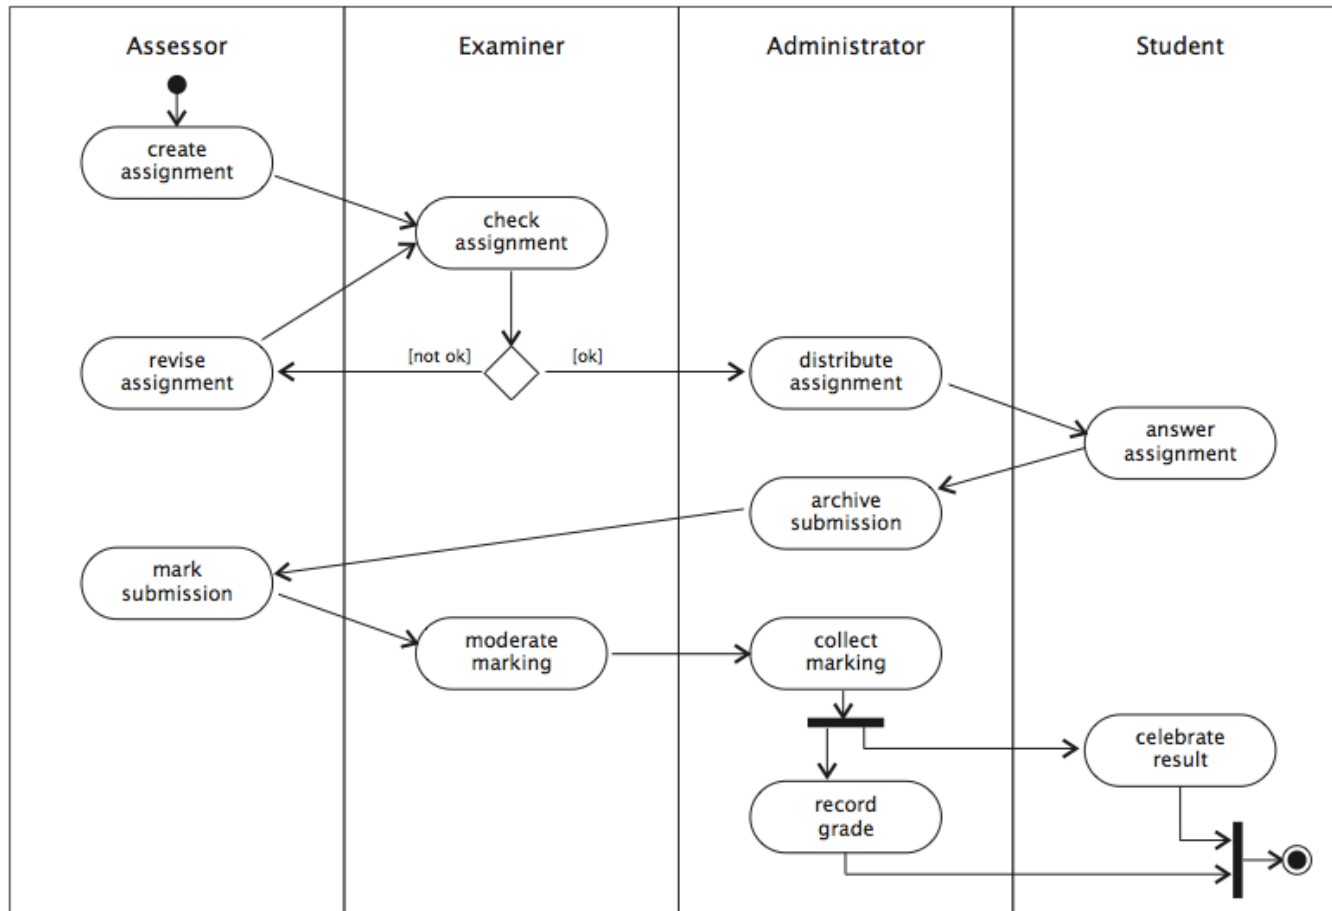

# Service Task

- Call a service
  - Unlike BPEL there is no direct way of capturing

# Swimlanes:

partition an activity diagram into the responsibilities of different entities

# Swimlanes represent different participants

ior(s).

© Paul Fremantle 2012. Portions © Jeremy Gibbons 2010, © WSO2 2005-2012 used with permission of the author(s).  
Licensed under the Creative Commons 3.0 BY-SA (Attribution-Sharealike) license.  
See <http://creativecommons.org/licenses/by-sa/3.0/>

# Data Flow

- Transitions between activities represent *control dependencies*: one activity must complete before another can start
- Workflows also have *data dependencies*: one activity produces a result that another requires
- UML activity diagrams allow *object flow* as well as *control flow*
- Dependent data is shown as an object icon (rectangle with underlined name and type)
  - *dependencies* shown as dashed arrows from generating activity to object, and from object to consuming activity(s)
  - same object may occur multiple times in an activity diagram, typically in different *states* (shown in square brackets after object name)

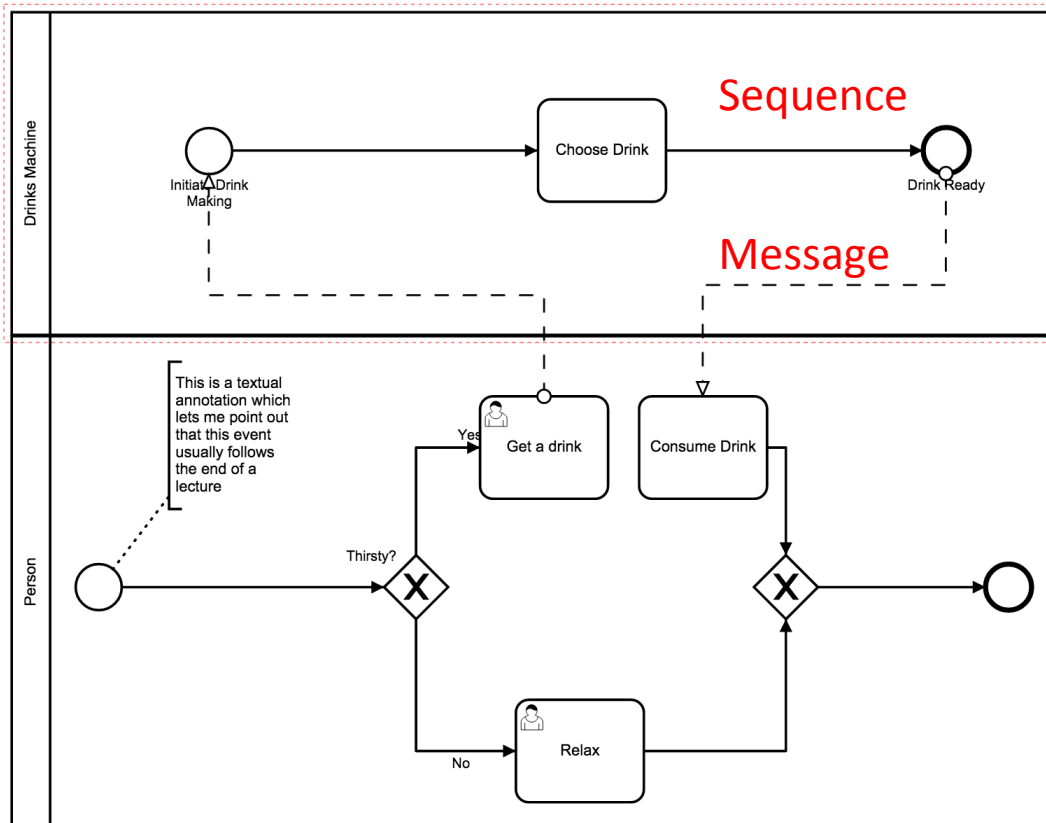

# Example Object Flow

# Flows

Sequence flows are within a Swimlane

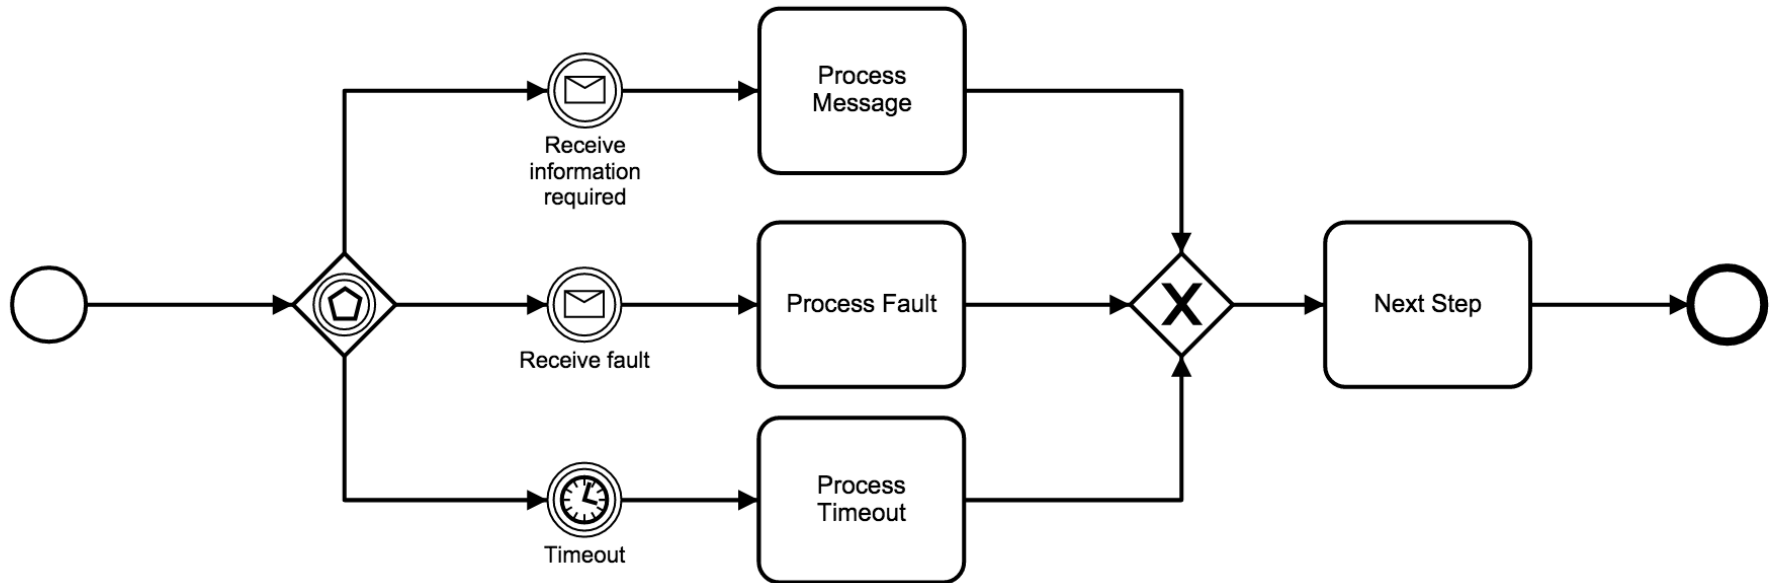

Message flows between swimlanes

# Gateways

- Exclusive Gateway
  - Fork – choose one path (if/else)
  - Join – wait for a single event
- Parallel Gateway
  - Fork – do both / all paths
  - Join – wait for all inputs

# Event Gateway

*An Event Gateway allows  
different events to trigger  
different actions*

# Complex Gateway

# How much BPMN do you need?

How Much Language is Enough?  
Theoretical and Practical Use of the  
Business Process Management Notation

[http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=2038665](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2038665)

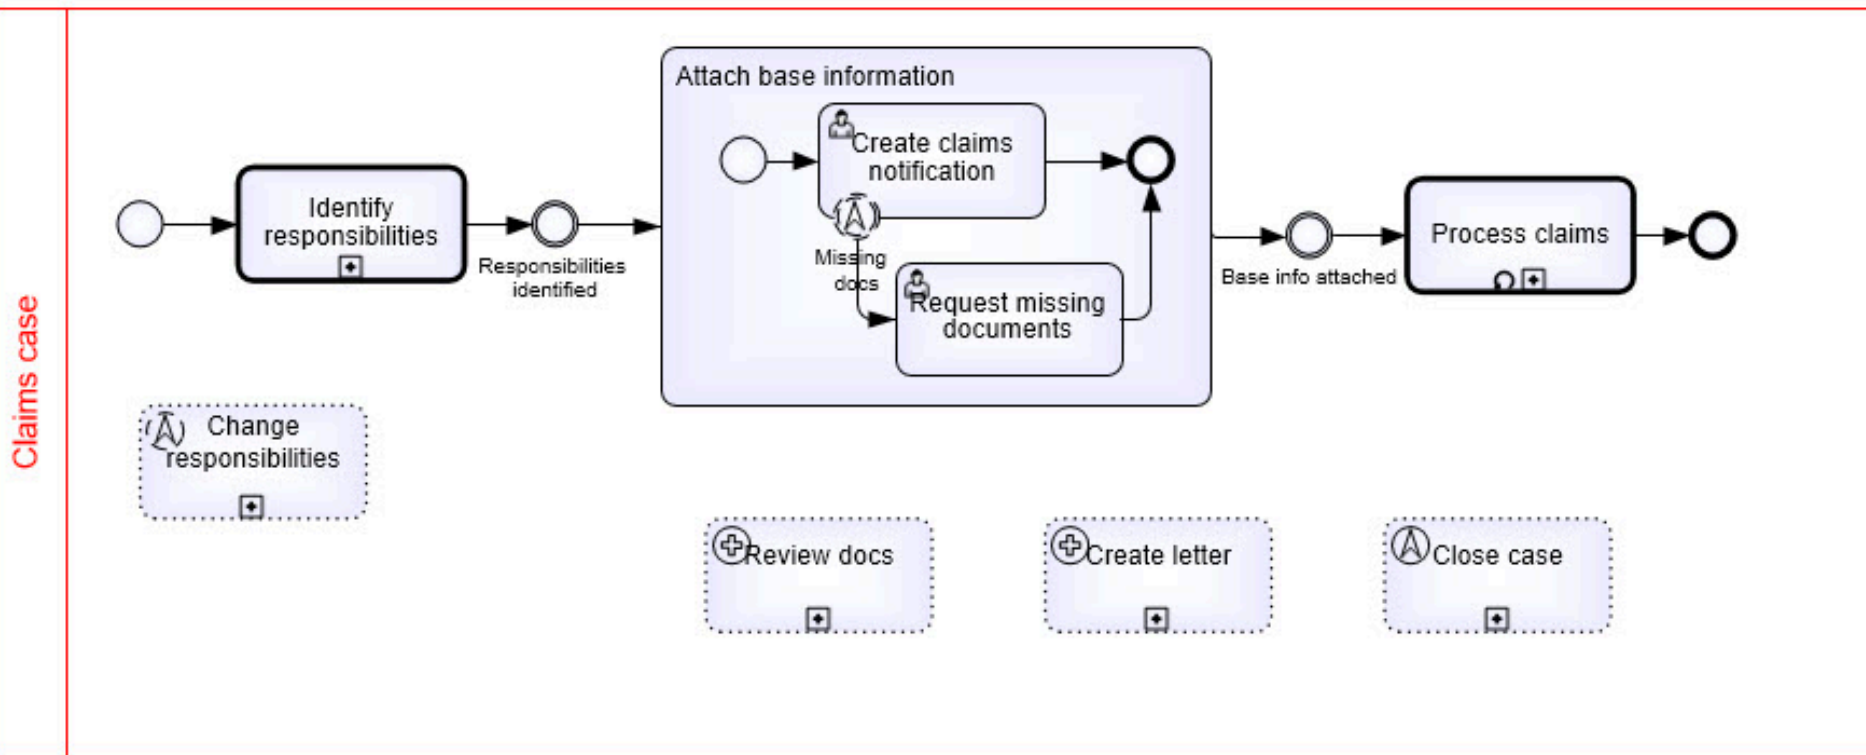

Fig. 1. Occurrence Frequency of BPMN Constructs

# BPMN Case example

Source: <http://brsilver.com/bpmn-cmmn-compared/>

# Summary

- Process Management has a strong place in composing SOA systems
  - Externalising dependencies
  - Agility
  - Sharing with the business owners
- BPEL is still widely used, but
- BPMN 2.0 is gaining a lot of mindshare
- CMMN also has a smaller but active following
- Other approaches like Amazon SWF may also gain traction
