# Key manipulation

- JDK keytool
- OpenSSL
- A keystore
  - Private Keys
  - Certificates
- Types
  - PKCS12
  - JKS

- Client and service should share each other's public keys

# Requirement

- Two keystores for the service and client
- Signed by a CA
- Make sure you have
  - OpenSSL
  - JDK

# Simple Certificate Authority

- `$ openssl req -x509 -newkey rsa:1024 \`
- `-keyout cakey.pem -out cacert.pem -config openssl.cnf`

- This creates

cakey.pem

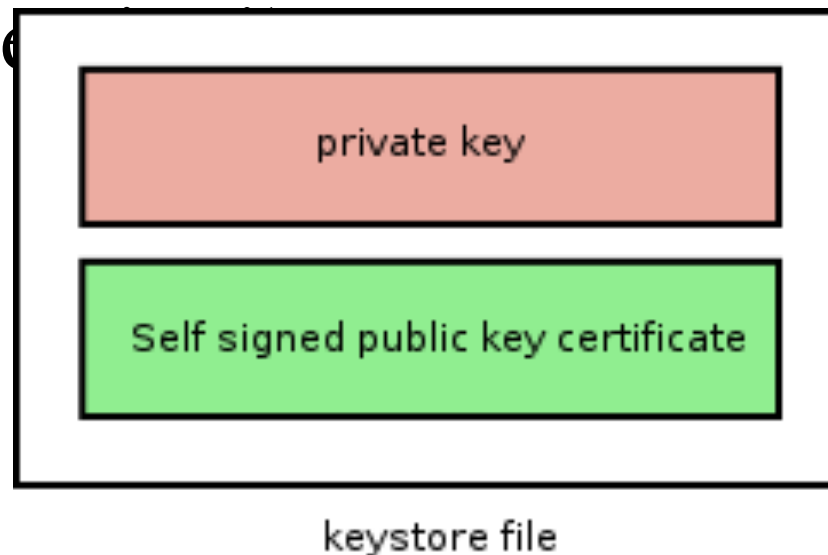

cacert.pem

# Client and Service Keys

- `$ keytool -genkey -alias client -keyalg RSA -keystore client.jks`
- `$ keytool -genkey -alias service -keyalg RSA -keystore service.jks`

# Now we need our CA to sign the public keys

# Certificate Signing Request (CSR)

- `$ keytool -certreq -keystore client.jks -storepass changeme -alias client -file client.cert.req`
- `$ keytool -certreq -keystore service.jks -storepass changeme -alias service -file service.cert.req`

# Sign the CSRs

- `$ openssl ca -config openssl.cnf -out client.pem -infiles client.cert.req`
- `$ openssl ca -config openssl.cnf -out service.pem -infiles service.cert.req`
- And convert the signed certificates and CA cert to DER
- `$ openssl x509 -outform DER -in client.pem -out client.cert`
- `$ openssl x509 -outform DER -in service.pem -out service.cert`
- `$ openssl x509 -outform DER -in cacert.pem -out cacert.cert`

# Import Certificates

- Import CA certificate
- `$ keytool -import -file cacert.cert -keystore service.jks -storepass changeme -alias ca`
- `$ keytool -import -file cacert.cert -keystore client.jks -storepass changeme -alias ca`
- Import signed certificates
- `$ keytool -import -file client.cert -keystore client.jks -storepass changeme -alias client`
- `$ keytool -import -file service.cert -keystore service.jks -storepass changeme -alias service`

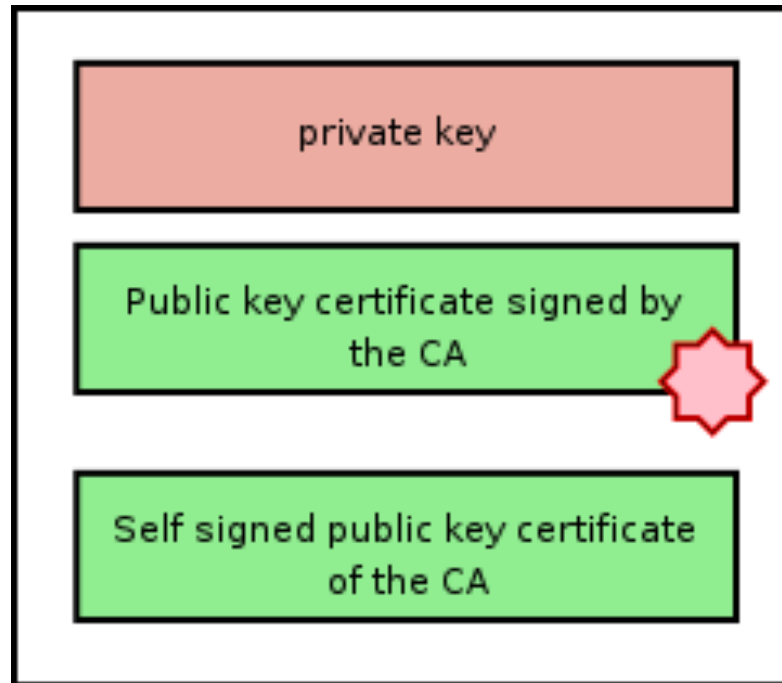

# Importing Peer Certificates

- To be able to directly trust the other
- `$ keytool -import -file client.cert -keystore service.jks -storepass changeme -alias client`
- `$ keytool -import -file service.cert -keystore client.jks -storepass changeme -alias service`

# Now our service and client keystores are ready!

keystore file
